Tidy data

"Happy families are all alike; every unhappy family is unhappy in its own way." Leo Tolstoy

- Hadley Wikcham in "Tidy Data" defines the three qualities of tidy data which standardise the process of dealing with any data set:

1. Each variable forms a column.
2. Each observation forms a row.
3. Each type of observational unit forms a table.

- These three qualities are what the end product of the data tydying process must possess.
- *Messy data* is data which is not tidy.
- Applying the tidy data criteria standardises the structure of a data set, making exploration and analysis of data easier and less error-prone.

CASE STUDY Massachusetts Bay Transport Authority (MBTA) data from an excel file

Data on transportation in Boston, USA: monthly averages of weekday number of passengers (in thousands) by mode of transportation.

A snapshot of part of the data (not all columns are included), in excel format, is below.

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	**MBTA Avg Weekday Unlinked Passenger Trips (thousands)**												
2		mode	2007-01	2007-02	2007-03	2007-04	2007-05	2007-06	2007-07	2007-08	2007-09	2007-10	2007-1
3	1	All Modes by Qtr	NA	NA	1187.653	NA	NA	1245.959	NA	NA	1256.571	NA	NA
4	2	Boat	4	3.6	40	4.3	4.9	5.8	6.521	6.572	5.469	5.145	3.

- 4 variables: transportation mode, year, month, and monthly weekday average number of trips.
- The first row in the excel sheet is a title, so we skip this row when reading the data in.
- The NA character is "NA", not blank space which is the default value.

Do this first

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
```

```
mbta = pd.read_excel("mbta.xlsx", skiprows = [0], na_values = "NA")
```

```
#show the first 6 rows
print(mbta.head(6))
```

```

## [8 rows x 59 columns]
```

- Variables are mode of transportation, year, month and monthly average number of passengers.
- All column names, except for the first one, `mode`, are values of year and month combined.
- To correct this we use the `melt()` function

```
# melt all column name values, except the first one (the index),
#into the "year_month" column with the corresponding values
# in the column "NrPassengers"
#
mbta2 = mbta.melt('mode', var_name = "year_month", value_name = "NrPassengers")
print(mbta2.head(10))
```

```
##                 mode year_month  NrPassengers
## 0               Boat    2007-01         4.000
## 1                Bus    2007-01       335.819

```

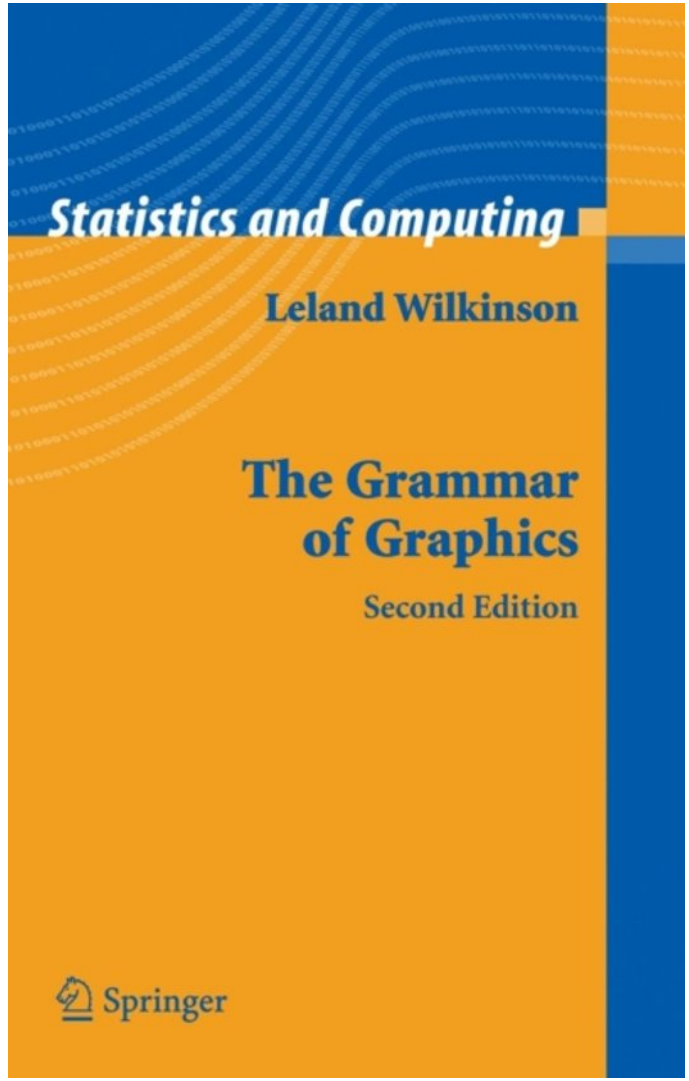
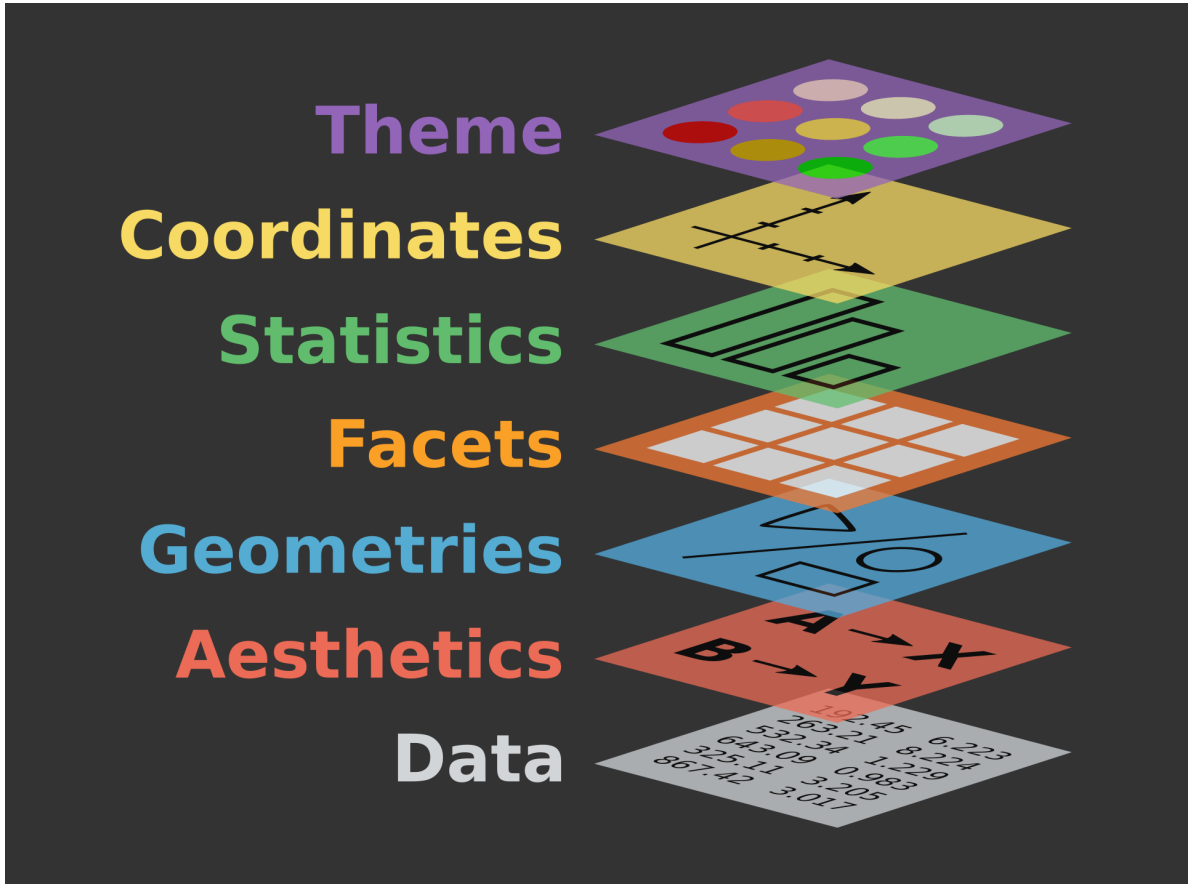
- The data is tidy and ready to be explored.

Visualisation using `plotnine`

- `plotnine` is a Grammar-of-Graphics-inspired package written by Hassan Kibirige.
- It brings the advantages of `R`'s `ggplot2` to `Python`: less coding and more meaningful syntax.



"A grammar of graphics is a tool that enables us to concisely describe the components of a graphic. Such a grammar allows us to move beyond named graphics (e.g., the "scatterplot") and gain insight into the deep structure that underlies statistical graphics." H.Wickham in 'A Layered Grammar of Graphics'.



Using `plotnine` to visualise data

- The function `ggplot()`, in the package `plotnine`, is used to visualise data.
- The basic use is

```
(ggplot(myData, aes = (myMapping)) + myGeometryLayer)
```

- myData: data frame with variables to use in plot.
- myMapping: mapping from the data to the aesthetics (visual dimension) in the graph. For example, the mapping can be `x = Varx, y = Vary` for a scatter plot of `Vary` vs. `Varx`.
- myGeometryLayer: specify what you want, points, lines, boxes, etc. e.g.: `geom_point()` for a scatter plot, `geom_line` for a line plot, etc.
- One can add many layers to the basic ggplot object created with the `ggplot()` function.

In order to access the functions in `plotnine` first we execute

```
from plotnine import *
```

- In `plotnine` a plot is an object which can be re-called and modified.

```
fig = (
ggplot(mbta3, aes(x = 'mode', y = 'NrPassengers', color = 'mode'))
 + geom_boxplot()
 + ylab("Average weekday number of passesgers (1000s)")
 + ggtitle("Boxplots of average number of passengers by travel mode")
 + theme(axis_text_x=element_text(rotation=0,ha='center',size=5,weight='bold'))
 + theme(title = element_text(size=8, weight='bold'))
 + theme(legend_text = element_text(size = 7.8))
 + theme(legend_key_size=5)
 + theme(subplots_adjust={'right': 0.8})
 )
#print(fig)#if you want to view the figure

Trackless Trolley

- Different scales for the data corresponding to the number of passengers travelling by boat, car, trackless trolley and private bus.

```
#aux has already been defined but here it goes again
aux = mbta3[ mbta3['mode'].isin(['Boat', 'Private Bus', 'RIDE',
          'Trackless Trolley']) ]
fig = (
  ggplot(aux, aes(x = 'date', y = 'NrPassengers', color = 'mode')) +

Boat
Private Bus
RIDE
Trackless Trolley

- Strong seasonal component in number of passengers travelling by boat.
- The use of RIDE seems to be steadily increasing during time.
- The use of private bus and trackless trolley had a sharp decrease since 2009 and something unusual made the use of trackless trolley dramatically decrease in the second half of 2010.

```
aux2 = mbta3[ mbta3['mode'].isin(['Bus', 'Commuter Rail', 'Heavy Rail',
          'Light Rail']) ]

Bus
Commuter Rail
Heavy Rail
Light Rail

- The number of passengers travelling by light and commuter rail has decreased since 2009.
- There seems to be an upwards trend on number of passengers travelling by heavy rail and perhaps by bus as well.
